Pedalites

John Bric on Jan 20th, 2010

Pedalite bicycle pedals are a new design made in help improve the safety or riders across the globe.

The Pedalites are new inventions which flash lights while users are pedalling.

And, the best part about it all is that it uses no batteries and relies solely on kinetic energy to allow the lights to keep flashing.

That's right, so the more you pedal, the more the lights will flash and the good news is that even when you stop at the lights, or at the side of the road for a breather, the lights will remain flashing for a few minutes before all the kinetic energy is gone.

The pedals work on three integral bright LEDs, one facing forwards, one backwards, and one sideways – or rather sideways, as you pedal.

The new light flashing pedalites are a great way to improve safety and ensure you are doing your part to remain safe on your bike.

The new pedalites are used in more than 20 countries across the globe and retail down under for around one hundred dollars.

SPECS:

- Set of two 360 degree visibility bicycle pedals
- Red, white and orange lights flashing from back and side of pedals
- Battery free lights, powered by kinetic energy
- Lights flash up to five minutes after you have stopped pedalling
- Visible from one kilometre away
- Pedals come with two rows of super grip studs for safety
- Screw-in replacements
- Suitable for those aged 8+
- 12cm X 9.5cm X 3cm – pedal sizes
