Combine these pedals with the [Bicygnals](#) and you will shine like a disco ball.

It is, of course, very important to be highly visible on your bike, but as any cyclist knows, being cool often comes first, even if it shouldn't. Well now you can dramatically improve your visibility without looking like an out of work actor dressed up as a Lollipop person. Pedalites are the latest cycling phenomenon and are, to put it bluntly, uber cool. These kinetic energy powered (no batteries, ever!) 360 degree light-up pedals simply replace your boring old pedals, and light your feet up like a Christmas tree.

As well as standard reflectors, the pedals have three integral bright LEDs, one facing forwards, one backwards, and one sideways - or rather sideways. As you pedal, kinetic energy powers up the LED's which flash brightly away, and the great thing about these is that this energy is stored in the pedals, so even as you free wheel or stop at a crossing (of course you do...) the pedals continue to flash for up to five minutes!
