

Brighten up those pedals on your bike with LEDs

<http://thisvirtualworld.com/2008/03/12/brighten-up-those-pedals-on-your-bike-with-leds/>

Now this very cool!! Those of us who are avid bicyclists, can totally appreciate any new gadget designed with safety in mind, as well as bringing a unique style to our favorite wheels.

Pedalites are the latest cycling phenomenon, bringing visibility to a whole new level. These kinetic energy powered (no batteries, ever!) 360 degree light-up pedals simply replace your boring old pedal. As well as standard reflectors, the pedals have three integral bright LEDs, one facing forwards, one backwards, and one sideways. As you pedal, kinetic energy powers up the LED's which flash brightly away, and the great thing about these is that this energy is stored in the pedals, so even as you free wheel or stop at a crossing (of course you do...) the pedals continue to flash for up to five minutes! This is brilliant as 75% of accidents happen at crossings, no doubt due to the fact that as bright as your head and tail lamps might be, side-on you make a darn big and dark target for dozy motorists. The pedals are durable and non-slip, simply screw in to replace your existing pedals.

Features

Orange, red and white lights flash from the front, back and sides of the pedals

The lights are battery-free, powered only by kinetic energy as you cycle

The Pedalites store a small charge as you cycle, so the lights continue to flash for up to 5 minutes when you have stopped pedaling

The lights are visible from 1km away

The Pedalites are themselves durable and non-slip

Each Pedalite has 2 rows of supergrip studs for safe pedaling

The Pedalites screw-in in replacement of your bike's existing pedals

Suitable for ages 8+ years (an adult must attach the Pedalites to the bike)

Size 12 X9.5X3cm (per pedal)
